

Is your Joomla! site hacked, not performing optimally or just broken?

Our Joomla! Rescue Service can help you get back quickly.

We have years of experience in repairing all types of hacks, malware and viruses for Joomla! sites worldwide.

If you have a website you'll know that keeping it secure is a full time job. Hackers are constantly testing sites for weaknesses and vulnerabilities so they can use them as email spamming relays, fake banking login pages or selling viagra and other pharmaceuticals. Sometimes they just want to deface your site for the fun of it.

The end result can be as little as disruptive downtime or as serious as customer data loss or domain blacklisting. Joomla! can be secure but it's a very popular website platform and as such attracts a lot of attention from the wrong sort of people.

We have over 10 years experience in building, managing and repairing Joomla! sites from around the world. We can get you back online and functioning quickly and fix any security holes which allowed the hackers in in the first place.

We can even work with you get your site removed from the Google Malware list and IP blacklists.

Once repaired our **Joomla! Managed Hosting** will not only keep your site secure and monitored but allow rapid recovery in case of any downtime and give you from 30 minutes up to 10 hours of 'any use' support per month.

What's next?

Talk to us about your Joomla! website and we'll prepare a detailed proposal including time-frames and ongoing support.
